DETAILED ACTION

Applicant's election with traverse of Group I, claims 1-5 in the reply filed on 2/17/09 is acknowledged. The traversal is on the ground(s) that the claims in groups I-III require common elements and do not require an additional search. This is not found persuasive because the search is based on different classifications of each group and constitute an undue burden in that the search for groups II and III do not require any steps of the process, as required in group I.

The requirement is still deemed proper and is therefore made FINAL.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over WO 01/66609 of record on 1449.

The reference discloses a process for forming a composition by contacting a hydroxyl functional organic compound having a functionality of two or more such as hydroxyl functional polyethers, hydroxyl functional polyesters, polyacrylates, polyolefins- (see page 3, lines 11-17) with the claimed carbonyllactam (see page 1, line 30 onto page 2, line 10) in the presence of the claimed strong base (see page 2, line 29 onto page 3, line 10).

The disclosure of the reference differs from the instant claims in that it does not disclose the reaction's temperature, ranges between room temperature and 80 C, s in the claims.

However, the reference does disclose in Examples I and II that the original temperature is at 100 C and then the extrudate was cooled in that the temperature is not determined. However, said reaction's temperature must be much lower than 100 C and can be overlapped with the claimed range.

Therefore, it would have been obvious to one of ordinary skill in the art to modify the reaction's temperature in the reference within the limitation of the instant claims since they have been shown to be effective in a similar system and thus would have been expected to provide adequate results. There is no showing of unexpected results derived from said modification.
